

BOMB THE CITY

**YOUR CALL
TO SEED
BOMB**

Bee populations and native plant species have been struggling with the encroachment of non-native plants and the vanity of manicured lawns for so long, this is your chance to be part of the resistance to the ecological colonialism that has plagued the world.

Once these bombs are ready to go, go out into the city, get them wet, and toss them wherever they are needed. Find abandoned plots of land, parks hosting a plethora of invasives, anywhere you like.

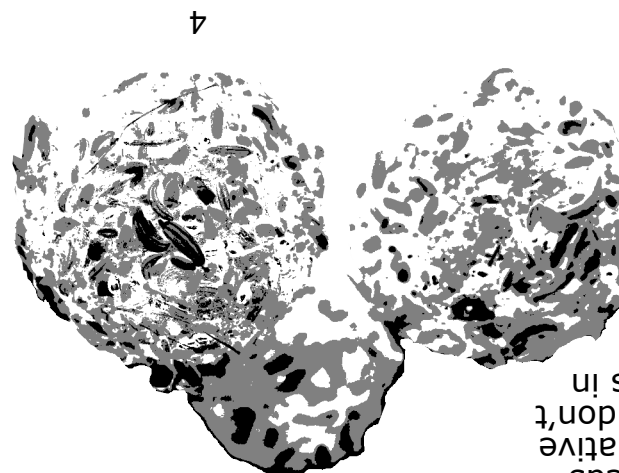

You see those empty patches of grass? Those lots no one's used for years? You want to help native bee populations? You ever want to see them growing beautiful flowers instead of being depressing monuments to capitalism?

THEN BOMB THE CITY

Here's how...

Once your mixture is ready, make golf ball sized balls with it and make sure to set them to air dry for a few days before using.

You can do this pretty easily with materials like paper, flour, and dirt.

For dirt bombs, you want to use a mixture of soil and red clay with a ratio of about 2:3 by weight.

Paper bombs require you to soak the paper and blend it into a pulp, draining it of excess water as you work.

A flour bomb requires a 1:2 ratio of flour to compost.

Regardless of which method you use, make sure to mix seeds into the mixture. You can add compost and other nutrients to any of the mixtures until you get the desired mix. The seeds you use should be native to your area, as we don't want more invasives in the area.
